

# Variable Body Image – Evaluation Framework of Robot's Appearance using Movable Human-like Parts

Keio University

Hiroataka Osawa, Yuji Matsuda,  
Ren Ohmura, and Michita Imai

Keio University

# Introduction

- We propose Variable Body Image for evaluation tool of HRI
  - To evaluate robot's appearances **comparable** in **running situation**

# Related HRI studies (1/3)

- Normal HRI uses one independent robot

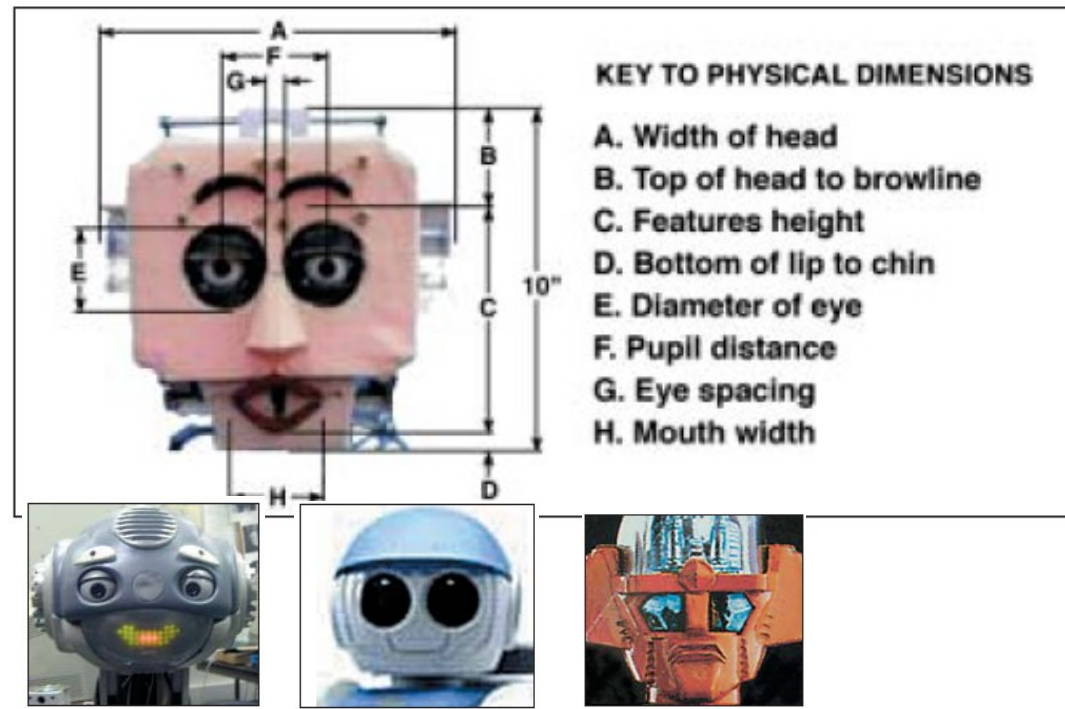

# Related HRI studies (2/3)

- It is difficult to compare the results of each evaluation
  - There are no standard appearance of a robot

# Related HRI studies (3/3)

- Paper test is already conducted [DiSalvo et al. 02]
  - However, it's just paper test.

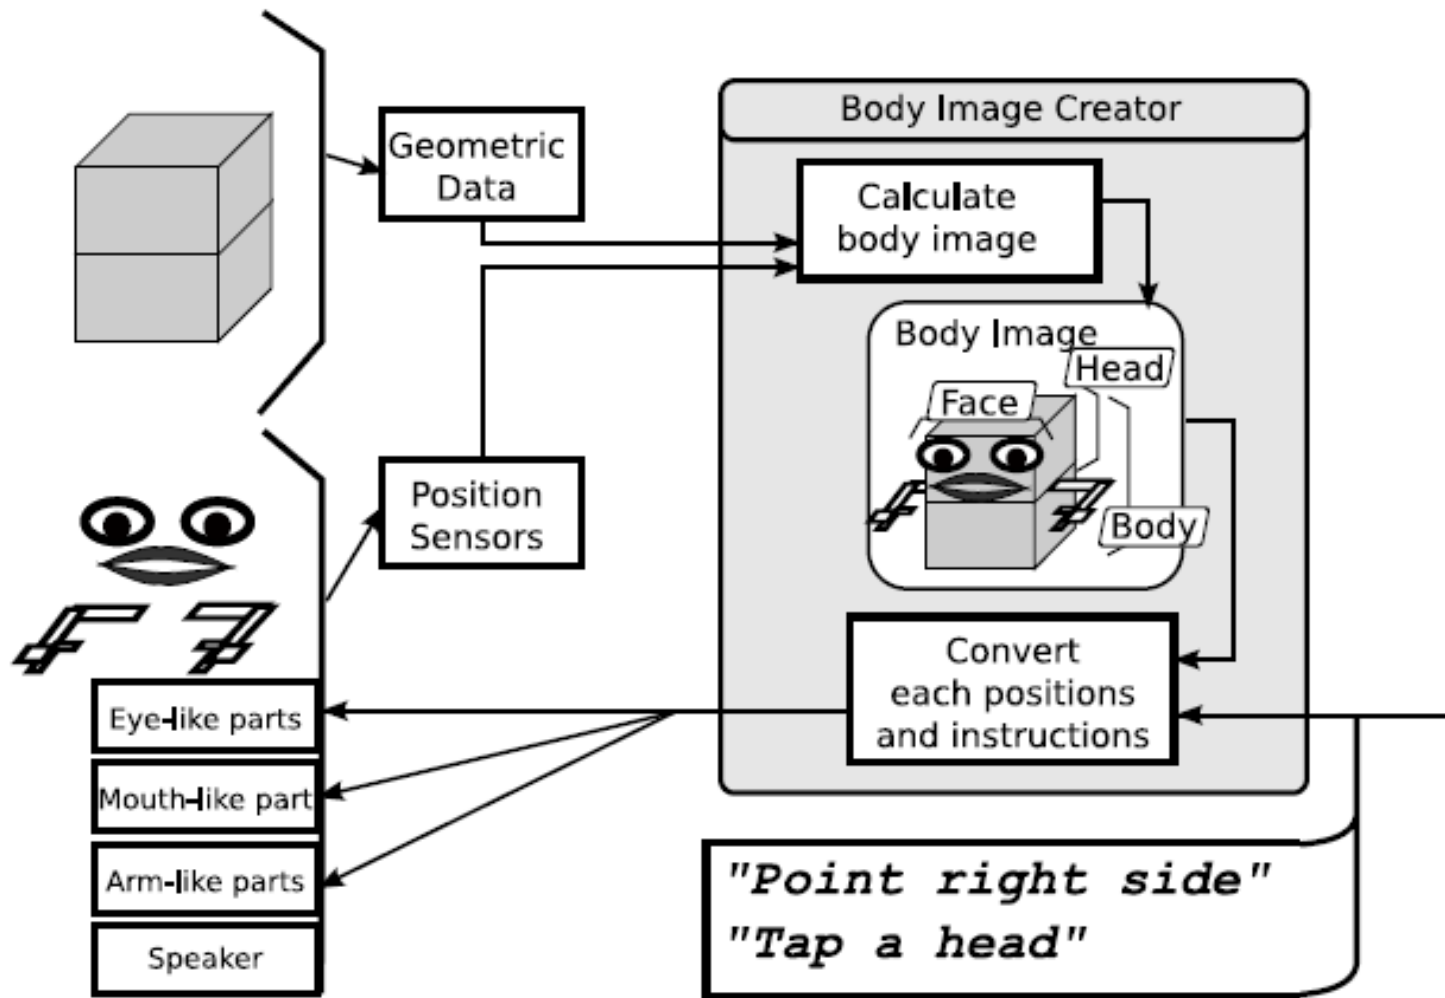

# Our approach

- We attach human-like parts to the robot additionally and gave it difference appearance
  - You can evaluate multiple appearance immediately

# Design of the framework

# Implementation of each parts

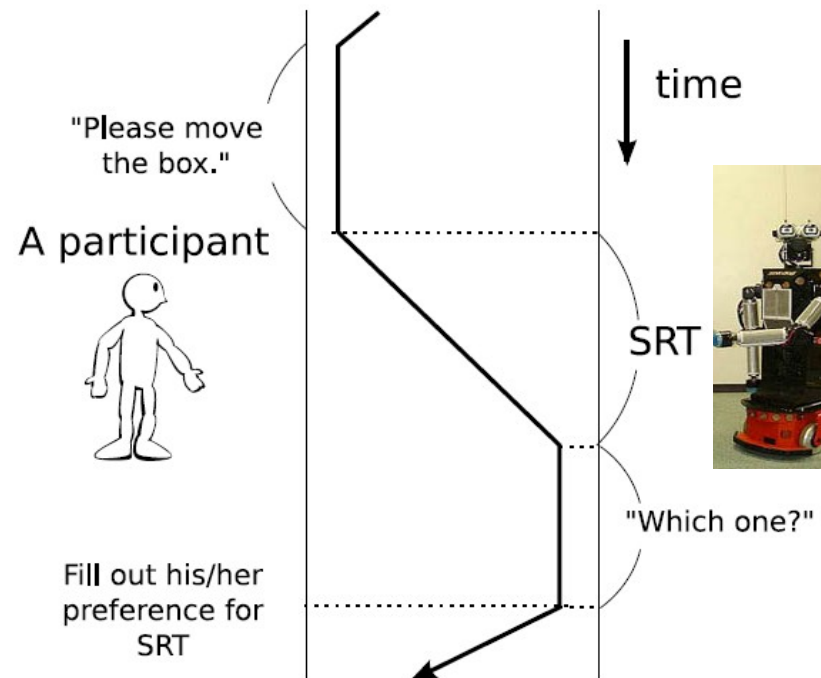

# Experiment using variable body image

1. What is critical element to recognize robot as agent?
  - Voice? Appearance?
2. What appearance parts is more important to achieve communication?

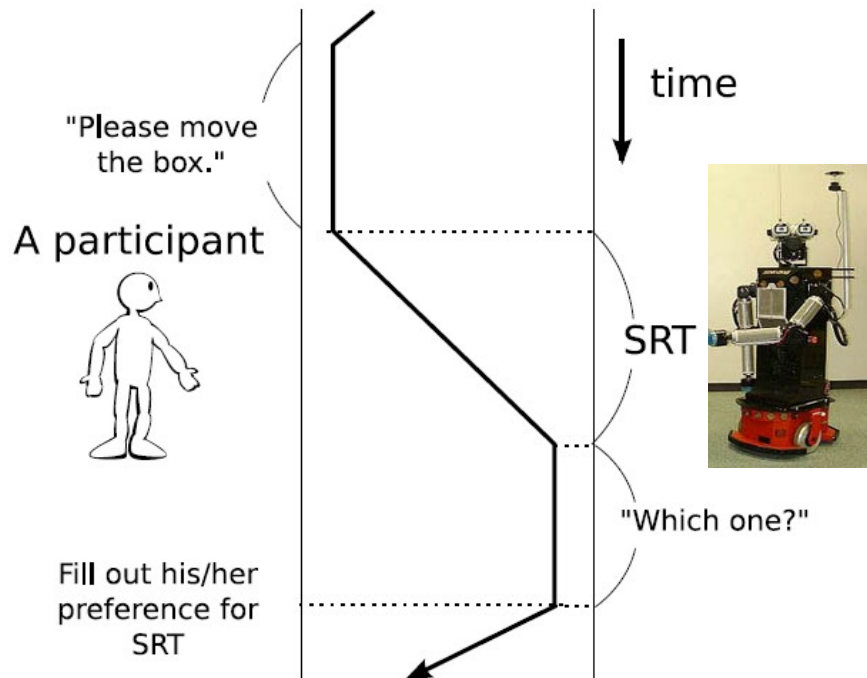

# Evaluation method (1/2)

- We used system response time (SRT) [Shiwa et al, HRI08]

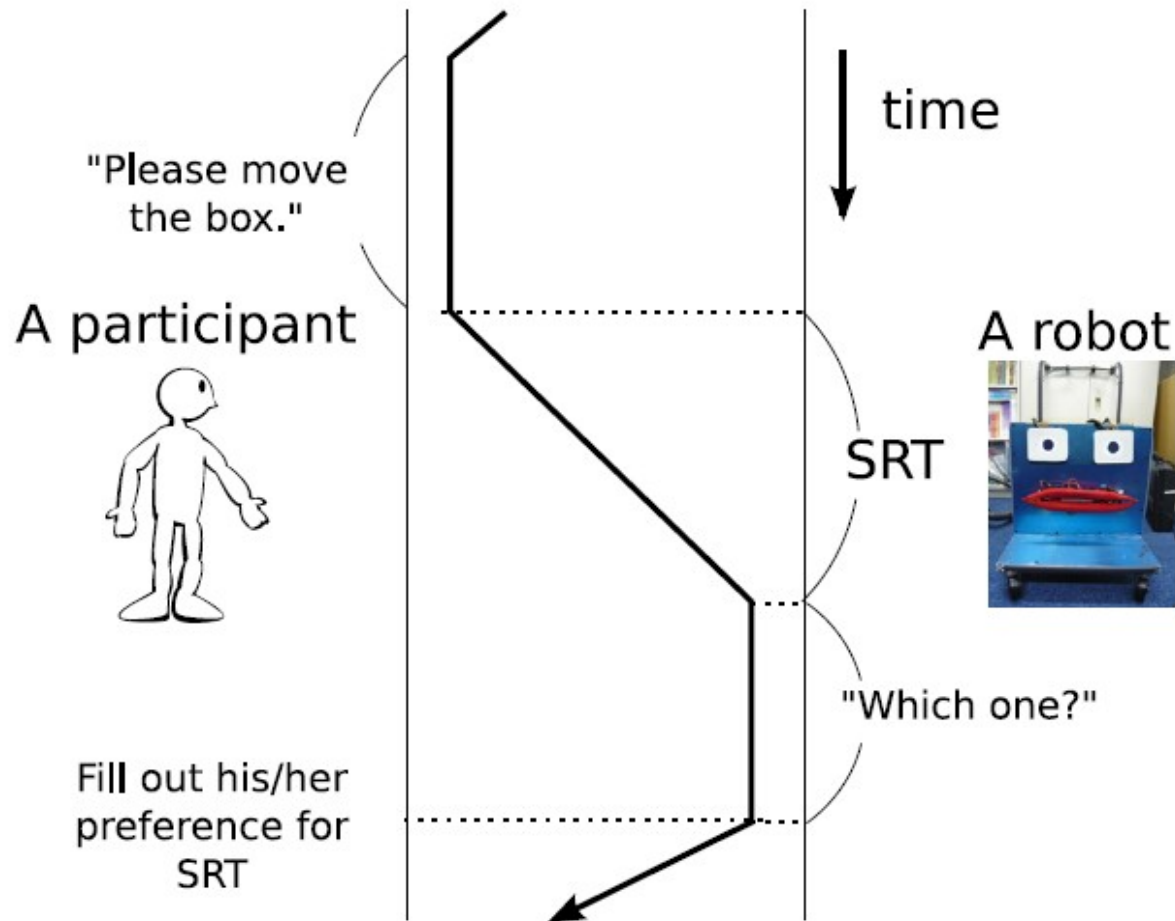

# Evaluation method (2/2)

- We used system response time (SRT) [Shiwa et al, HRI08]

# Communication flow

# Field design

# Dialog

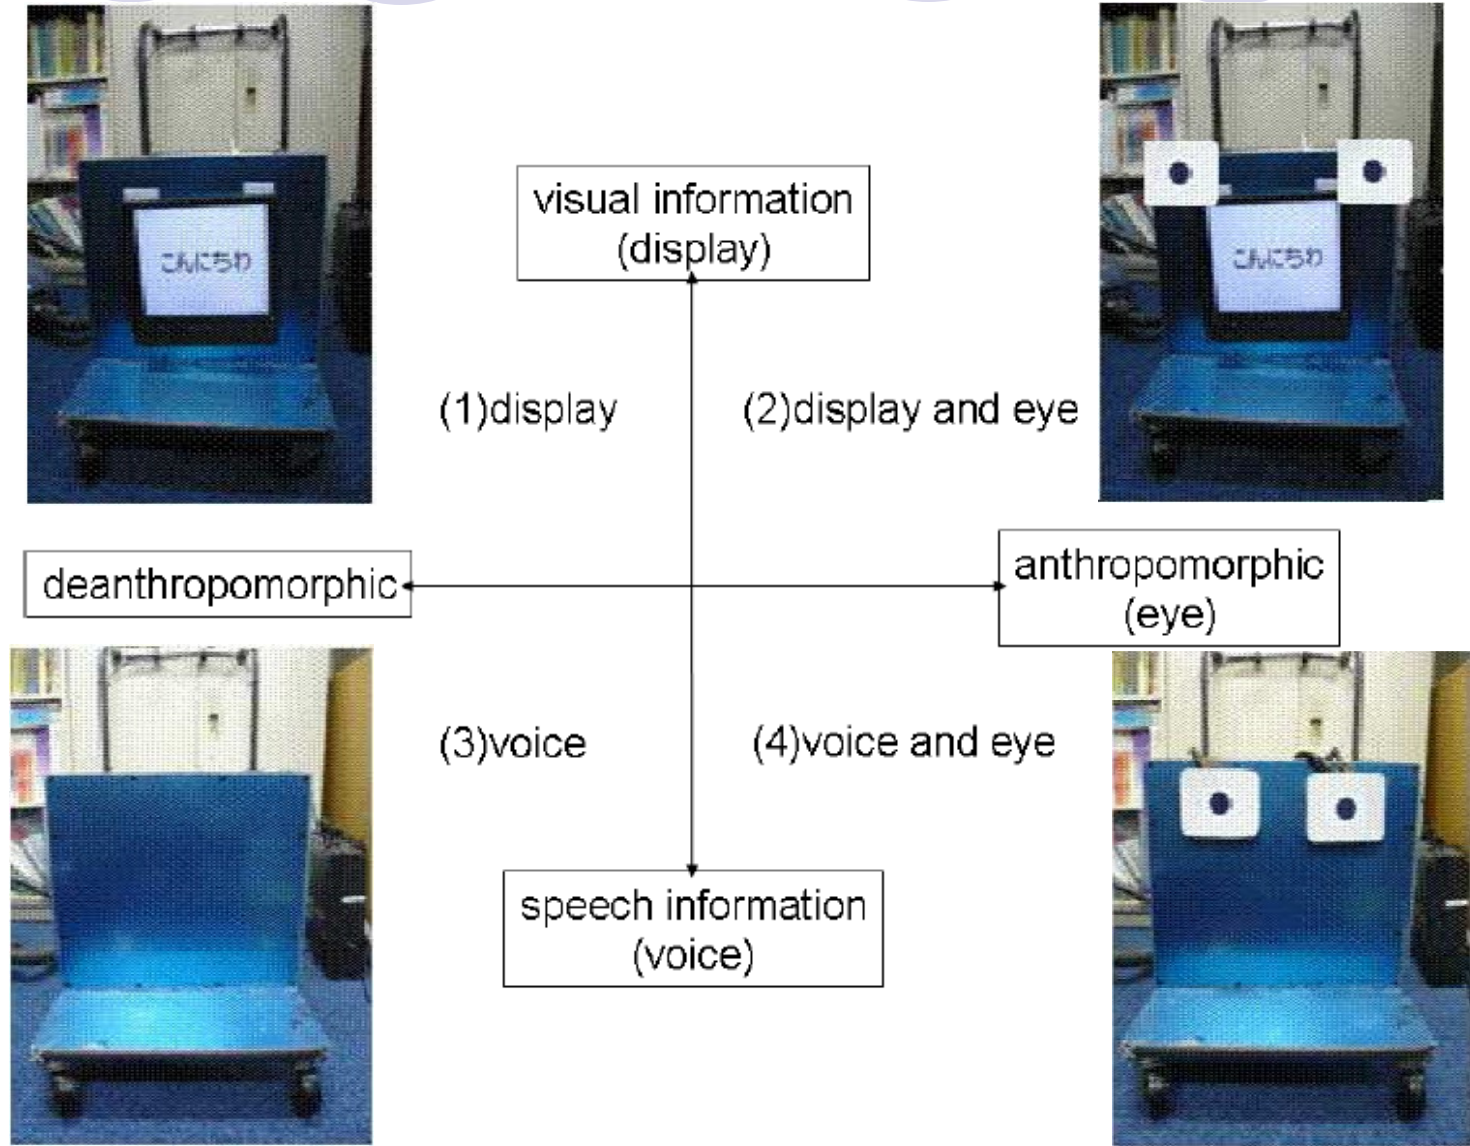

User(action)	Robot(response)
"Hello"	"Hello"
"Please move the box."	"Which one?"
"That one!" (with direction of the right object)	"Okey, I understand."
"When do you move it?"	"About 6 P.M."
"Yes, please."	"Okey."
"Thank you."	"You're welcome."

# Scene of the experiment

# Conditions of the experiment 1

# Participants

- Display, Voice, Voice and Eye
  - 33 participants: 22 males, 12 females
  - within subject design
- Display and eye
  - 27 participants: 19 males, 8 females

# Statistics

- ANOVA for 3 parameters
  - Appearance
  - Response time
  - Talk elements

# Result of the experiment 1

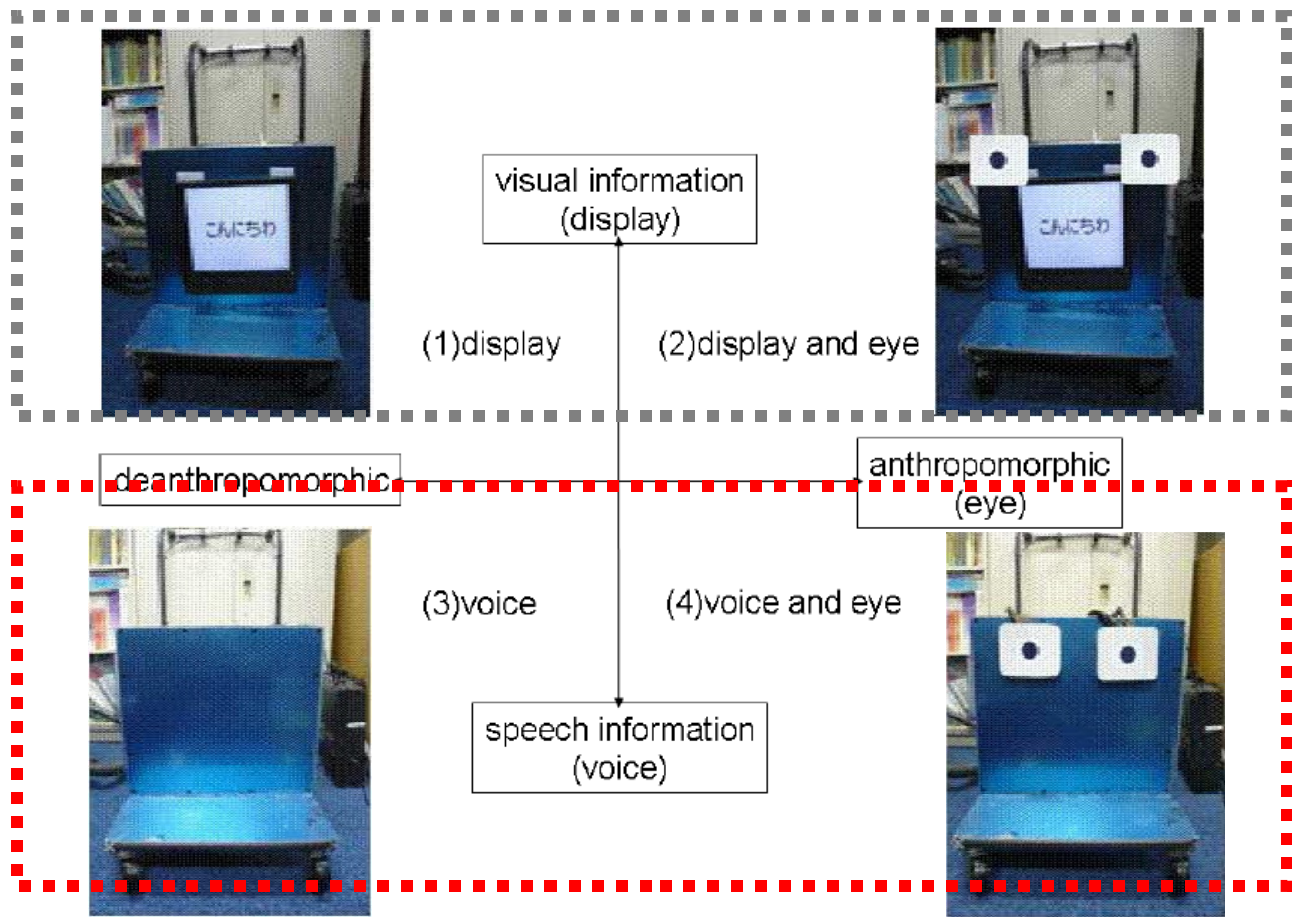

# Result of the experiment 1

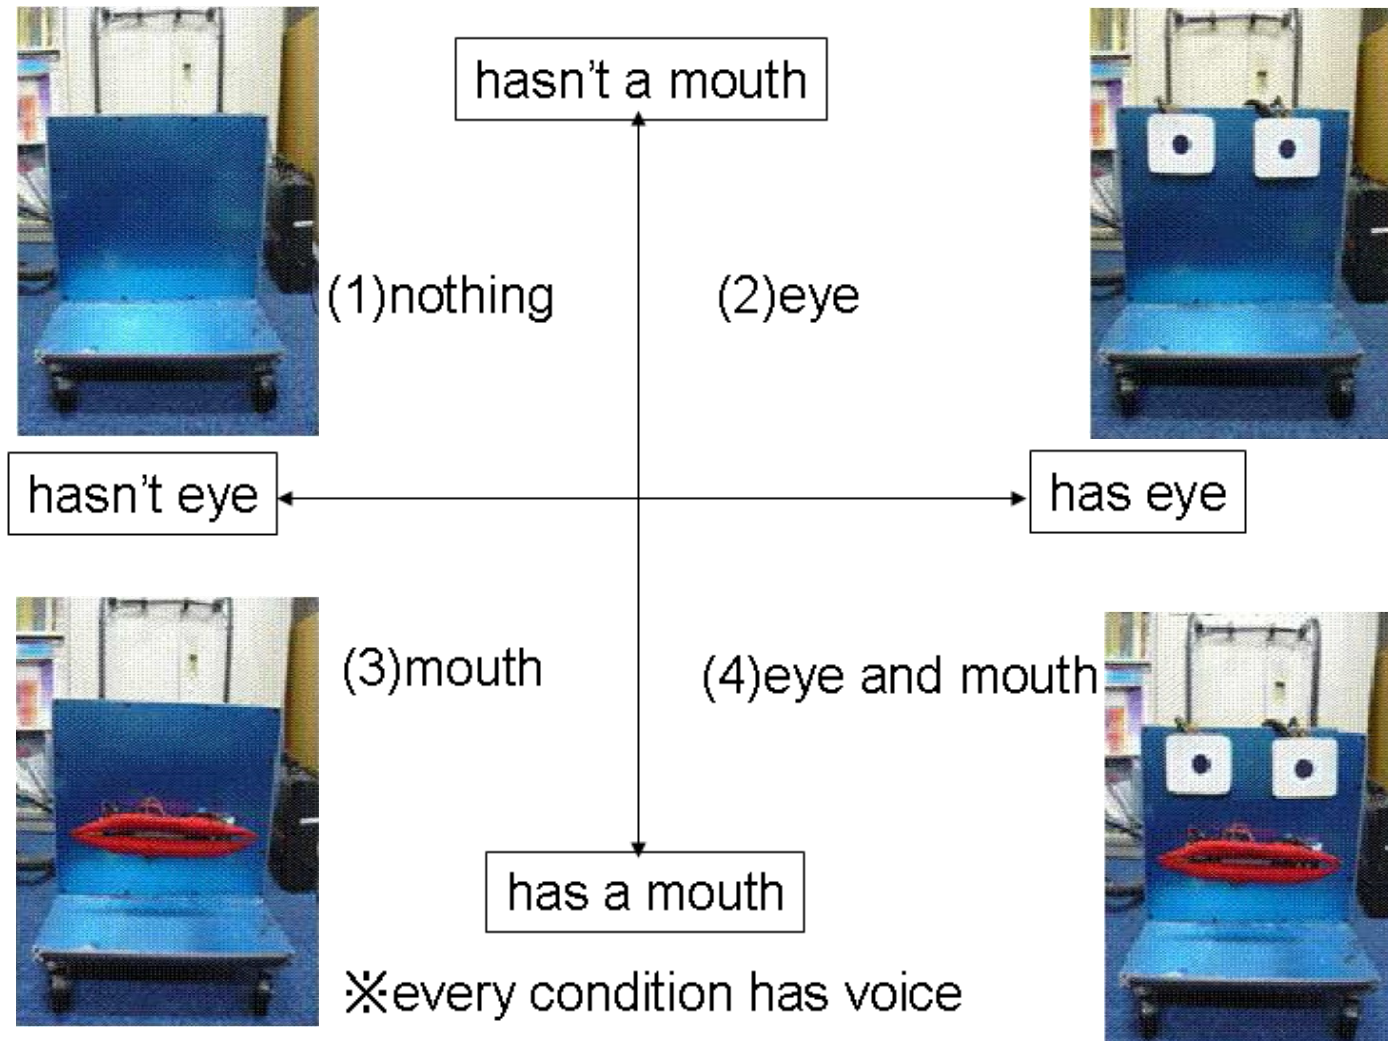

# Result of the experiment 1

- Voice is critical element

# Conditions of the experiment 2

# Participants

- 33 participants: 22 males, 12 females
  - within subject design

# Statistics

- ANOVA for 3 parameters
  - Appearance
  - Response time
  - Talk elements

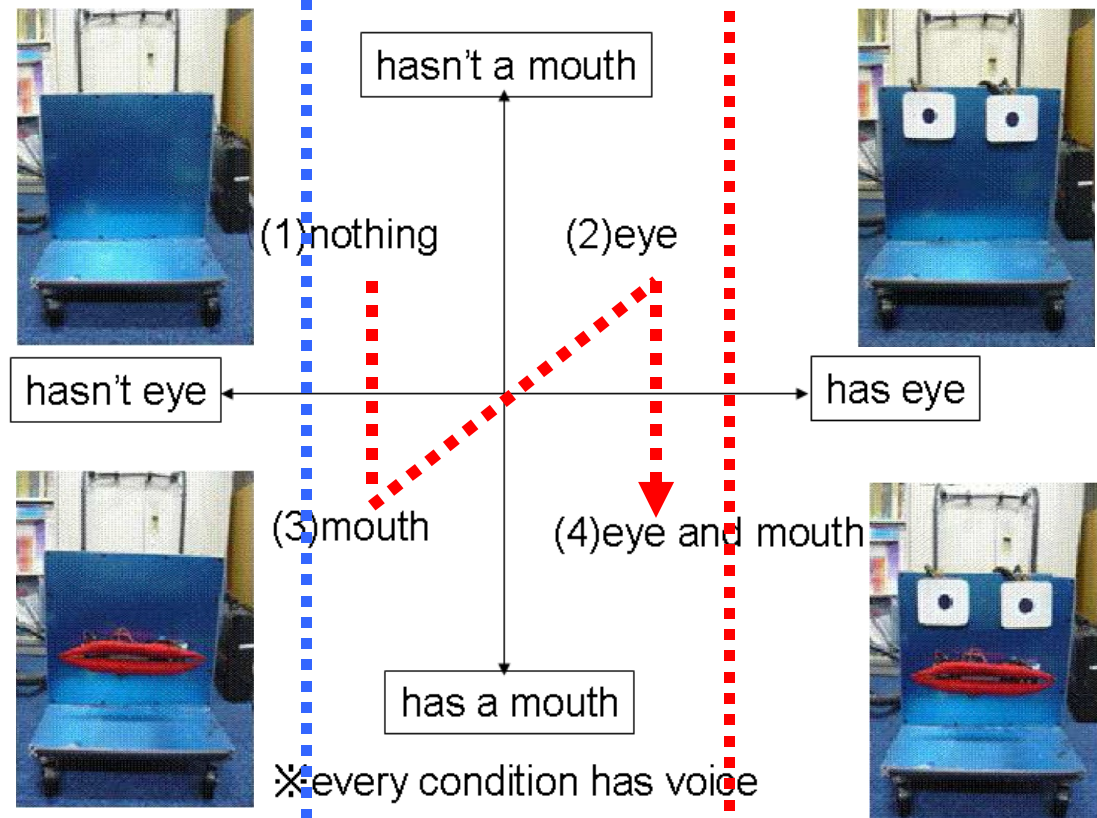

# Result of the experiment 2

# Result of the experiment 2

- Eye has more important role for interaction than mouth

# Future work

- Modifiable feature
- Determine detail robot's body scale

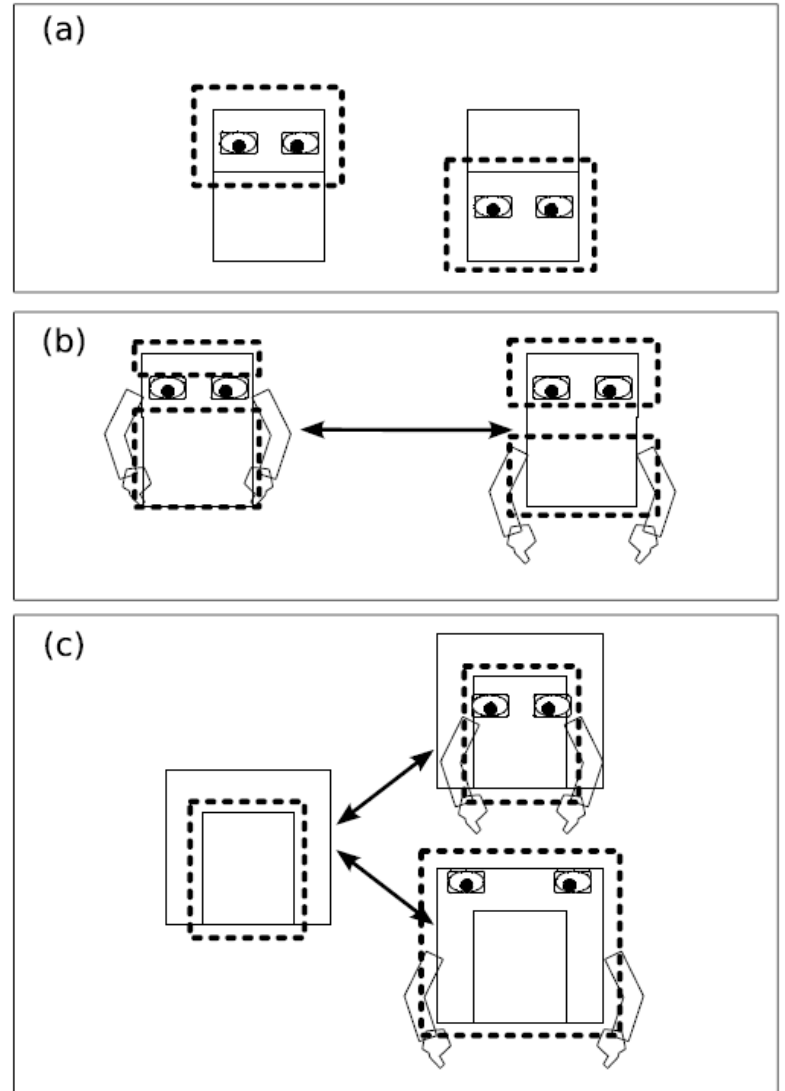

- To research more variable robot's design field **than pursue the design that imitated entire human**

# Future work

- Body image evaluation framework
  - With online

A decorative graphic at the top of the slide consists of two groups of three circles. The left group has a solid light purple circle on the left, a white circle with a light purple outline in the middle, and a solid light purple circle on the right. The right group has a solid light purple circle on the left, a white circle with a light purple outline in the middle, and a solid light purple circle on the right.

# Conclusion

- We propose Variable Body Image framework
- We test our framework by system response time of users

Thanks!
