### Aristotelian Virtue Ethics and the Problem of Friendship

Friendship seems too to hold states together, and lawgivers to care more for it than for justice; for concord seems to be something like friendship, and this they aim at most of all, and expel faction as their worst enemy; and when men are friends they have no need of justice, while when they are just they need friendship as well, and the truest form of justice is thought to be of a friendly quality.

-Aristotle, *The Nicomachean Ethics*

In *The Nicomachean Ethics*, Aristotle outlines his theory of morality using the concept of virtue. In this book, Aristotle focuses on what is required to live a life of eudaimonia (the good life). He argues that the key to living such a life is to live in accordance with virtues such as courage, honesty, and friendship. Consequently, Aristotle's morality focuses on what type of person the moral agent should be, rather than focusing on what the moral agent should do. The focus on character traits rather than direct action guidance distinguishes virtue ethics from other moral theories, such as consequentialism and deontology. One such character trait that has drawn significant attention is having a pro-friendship disposition. Critics have attacked both deontology and consequentialism for failing to provide a tenable account of friendship and for alienating the moralist from her relationships with others. Specifically, Michael Stocker argues that deontology and consequentialism cause "moral schizophrenia" by forcing the moralist to develop a rift between his or her actions and motivations (454). Furthermore, he argues that this discontinuity between actions and values is incompatible with true friendship. Philosophers like Peter Railton have tried to save consequentialism from this critique by moving to an indirect form of consequentialism, but this move only hides the underlying problem. Any tenable definition of friendship must focus on the moral agent in a way incompatible with the moral

point of view; a view necessitated by deontology and consequentialism. Additionally, both deontology and consequentialism force the moralist into an alienated state in which he or she cannot develop lasting and meaningful relationships without abandoning the moral point of view. Virtue ethics, on the other hand, provides a fundamentally different approach to morality by focusing on the character traits of the moralist and, thus, solves the problem of friendship. In this paper, I will argue that neo-Aristotelian virtue ethics distinguishes itself from consequentialism and deontology by providing a less alienating account of friendship than the competing theories.

In “The Schizophrenia of Modern Ethical Theories,” Michael Stocker presents a critique of both deontological and consequentialist ethics by questioning their ability to provide both action guidance and a system of moral motivation. In his words: “One mark of a good life is a harmony between one’s motives and one’s reasons, values, and justifications. Not to be moved by what one values...bespeaks a malady of the spirit. Not to value what moves one also bespeaks a malady of the spirit” (454). Here, Stocker outlines what he refers to as moral schizophrenia, a split between one’s motives and the reasons behind those motives. For instance, a moral agent acting under a hedonistic morality will value those actions that give him or her pleasure. In many cases, however, the most pleasurable actions require the agent to act from non-hedonistic motives. A mother giving a daughter a birthday gift, for example, will often find great pleasure in such an action. To fully experience this pleasure, the motives behind the mother’s gift-giving must come from something other than the pursuit of pleasure. Examples of such motives include a genuine care for her daughter, a desire to foster a loving relationship with her, or a desire to give to others. If the mother gives the gift solely because it will give her pleasure, she clearly misses out on much of the pleasure that she can gain from the gift-giving

action. Thus, for the mother to act as a successful hedonist, she must value motives that are non-hedonistic. Stocker describes this as a schizophrenic rift between values and actions.

After outlining his definition of moral schizophrenia, Stocker describes why this schizophrenia is a problem for modern ethical theories. Specifically, he claims that modern ethics precludes friendship and love. Describing the schizophrenic mindset, Stocker argues that “to think of yourself this way, or to believe that person you love thinks of you this way, is intolerable. And for conceptual, as well as psychological reasons it is incompatible with love” (456). Here, Stocker claims that the inability of modern ethical theories to provide a tenable account of love stems from both a psychological fragmentation and an inherent incompatibility of ethical rules with concepts like friendship. Psychologically, modern ethical theories force the moralist into a life that is incoherent and fragmented. Since there is no consistency between the moralist’s values and actions, he or she must fragment into a moral self and a non-moral self. Ethical action guidance motivates some of the moralist’s actions, and motives such as friendship motivate his or her other actions. This rift is psychologically difficult because it prevents the moralist from consistently determining the right thing to do in a given situation. The moralist has no mechanism to decide whether or not to act in accordance with morality or in accordance with his or her other motives.

Furthermore, Stocker sees a conceptual incompatibility between concepts like friendship and modern ethical theories. When one acts in accordance with deontological or consequentialist action guidance, one must inevitably take on a “moral point of view.” The moral point of view requires a separation of the agent from his or her subjective emotions in an attempt to act according to objective ethical rules. Stocker sees this move as a major problem: “What is lacking in these theories is simply – or not so simply – the person. For, love, friendship,

affection, fellow feeling, and community all require that the other person be an essential part of what is valued” (459). Here, Stocker identifies an important problem in taking on an objective viewpoint. Doing so eliminates important subjective motives, such as love, from the action guiding equation. Thus, modern ethical theories are incapable of conceptually describing concepts like love and integrating them into their moral structure. This inevitably results in a schizophrenic situation for any moralist who wishes to maintain meaningful friendships.

Stocker shows the problem of moral schizophrenia in deontological morality very clearly with his famous hospital example (462). In this example, Stocker places you as someone who is recovering in the hospital. As a result of your recovery, you are extremely bored, and you very much miss your friends and the company of others. Your friend, Smith, comes to visit you, and you are delighted at his arrival. After talking for a while, you question Smith as to his motives for coming, and you ask him why he took all of this time to come and see you. Smith replies that he feels that it is his duty as a friend to come and visit his friends when they are ill. Upon further questioning, you realize that this was his only motive for visiting you. At this point you are greatly saddened, and Smith’s visit no longer feels like a friendly one. Instead, it was an action done solely from objective moral motives, and it fails to embody any real conception of friendship. For Smith to truly be your friend, he must act on non-deontological motives. If he still wishes to be a deontologist, he suffers from moral schizophrenia.

In the hospital example, Smith acts solely from deontological motives, and his potentially friendly actions become cold and objective. Stocker points out that this illustrates deontological morality’s difficulty in providing a tenable account of friendship. I would add that this problem becomes even more apparent when we examine some of Kant’s claims in *Groundwork for the Metaphysics of Morals*. In *Groundwork*, Kant argues that the moral worth of an action comes

from whether or not it was done “from duty.” For him, morally good actions are those that correspond to universally generalizable rules. Furthermore, the moral worth of an action is determined by the extent to which that action was motivated by the agent’s duty to act according to these rules. In the example above, for instance, Smith is visiting you in the hospital solely from deontological motivation; he is acting from duty.

When examined in the context of friendship and moral schizophrenia, Kant’s arguments fail when he attempts to incorporate well-being into his morality. He states: “To secure one’s own happiness is a duty (at least indirectly), for the lack of contentment with one’s condition, in a crowd of many sorrows and amid unsatisfied needs, can easily become a great temptation to the violation of duty” (15). Here, Kant urges moralists to cultivate their own happiness to further their practice of dutiful ethics. By bringing in moral schizophrenia, we see that this claim is ineffective in providing consistent action guidance. As described above, Stocker shows that it is impossible for the moral agent to act according to deontological rules, cultivate his or her own happiness, and avoid moral schizophrenia at the same time. Kantians who seek to further their own happiness by acting from duty will either develop a rift between their motives and actions or be forced to completely forego subjective motivates such as love, friendship, and community. It is impossible to imagine a happy individual without these meaningful relationships. Thus, Kantian deontology cannot escape the problem of moral schizophrenia, and it fails to provide a tenable account of friendship.

Having shown that subjective motivations pose a problem for Kantian deontology, I will next discuss whether consequentialism can better avoid the problem of moral schizophrenia. In “Alienation, Consequentialism, and the Demands of Morality,” Peter Railton argues that an indirect form of consequentialism cultivates agent-centered dispositions that bring the agent’s

action and motivations into harmony. Railton uses the move to indirect consequentialism to avoid what he terms “moral alienation.” In his words: “Living up to the demands of morality may bring with it alienation – from one’s personal commitments, from one’s feelings or sentiments, from other people, or even from morality itself” (134). Railton’s idea of moral alienation grapples with the same problem as Stocker’s moral schizophrenia. For both philosophers, the move to the objectively moral point of view creates a psychological rift between the moralist and his or her actions. As with Stocker, Railton sees moral alienation as a psychological problem, and he argues that “it may be the basis of [psychological] afflictions – such as a sense of loneliness or emptiness...Moreover, their alienation may cause psychological distress in others, and make certain valuable sorts of relationships impossible” (137). Thus, moral schizophrenia and alienation both refer to the psychological rift created when an agent takes the moral point of view. Both Stocker and Railton see this as a problem in traditional deontological and consequentialist theories.

Unlike Stocker, Railton argues that a sophisticated consequentialist can overcome the problem of alienation while still maintaining a consequentialist morality. He uses the examples of John, Anne, Juan, and Linda to outline his solution to the problem of alienation.<sup>1</sup> In his first example, Railton describes a married couple, John and Anne. John, a consequentialist, describes his marriage to Anne as a case of satisfaction maximization. He sees himself as best able to increase Anne’s happiness because he knows her better than anyone else. Furthermore, John finds the process of making Anne happy personally satisfying (135). Railton contends that John and Anne’s relationship is “missing something” because John’s remarks are divorced from his

---

<sup>1</sup> Railton also talks about two friends, Lisa and Helen (135). When asked by Helen why she has continued their friendship through hard times, Lisa responds using deontological reasoning and claims that it is her duty as a friend to stay by Helen in difficult situations. Lisa is saddened by this response, and she feels alienated from the friendship. Railton uses this example to show that deontological morality also suffers from the problem of alienation.

affections and, instead, come from an impersonal point of view. The impersonal (moral) point of view of John's reasoning has resulted in his alienation from the marriage and his inability to develop relationships based on subjective affections like love and friendship.

After outlining the problem of alienation with the John and Anne example, Railton introduces a potential solution by claiming that a sophisticated consequentialist can act from motivations that do not involve consequentialist calculations. He states that the sophisticated consequentialist faces the following problem: "how to act in order to achieve maximum possible happiness if this is at times – or even often – not a matter of carrying out hedonistic deliberations" (143). To clarify the move to sophisticated consequentialism, Railton introduces the example of a highly competitive tennis player who realizes that his overwhelming desire to win is actually keeping him from winning (144). To combat this problem, the tennis player tries to focus more on enjoying the game, and his coach develops a psychological program to do so. The tennis player enjoys the game more and also achieves his overarching goal of playing well. Similar to the tennis player, Railton describes Juan, a sophisticated hedonist who marries Linda (150). When questioned about his marriage, Juan uses very different language than John. Juan claims that his care for Linda stems from a genuine affection and love for her. Additionally, he maintains a consequentialist viewpoint by saying that the world would be a happier place if more people acted with love and affection. Juan has a commitment to leading an objectively consequentialist life, but he does not do so solely from consequentialist deliberations. Railton contends that Juan's indirect consequentialism greatly reduces his moral alienation but still allows him to remain a consequentialist moralist.

While Railton's move to indirect consequentialism seems to close the rift between actions and motivations and solve the problem of friendship, further inspection reveals serious

deficiencies in his solution. In “Indirect Consequentialism, Friendship, and the Problem of Alienation,” Dean Cocking and Justin Oakley argue that Railton’s indirect consequentialism actually fails to account for the character traits necessary for true friendship. Cocking and Oakley compare Juan to a good doctor who might “give special attention to her patients over others...she might provide care for her patients for their own sake, rather than, say, for the sake of meeting her job requirements, but we would not necessarily regard her relationships with her patients as friendship” (92). Cocking and Oakley use this example to argue that professional relationships are grounded on different motivational and dispositional structures, and, thus, are not the same as true friendship. Relationships like those between doctors and patients are meant to provide a service for the patient, and, while these relationships may have a “friendly” quality, they fail to maintain the same affections and commitments as friendships. For instance, doctors will likely terminate their relationships with patients if their patients have overcome their illnesses and other patients need the doctor’s care. Similar to doctors, indirect consequentialists like Juan maintain their relationships for the sake of the betterment of themselves and others, and they are willing to terminate these relationships if they become consequentially disadvantageous. Furthermore, Juan must see his relationships in this way because, if his motivations were different, he would cease to be a consequentialist. Thus, Railton’s move to indirect consequentialism neither solves the problem of alienation nor provides a tenable account of friendship.

Having shown that consequentialism and deontology are both deficient in solving the problem of friendship, I will next argue that virtue ethics can provide a better solution. Furthermore, I will show that the nature of this solution shows a fundamental difference between virtue ethics and the other moral theories. In *The Nicomachean Ethics*, Aristotle devotes Books

VIII-IX to a discussion of friendship. Central to Aristotle's ethics is his concept of living well (eudaimonia), which he describes as living in accordance with the virtues. He places friendship as one of the virtues necessary for living well, and he describes a pro-friendship disposition as an important state of character for the virtuous person. After examining virtue, Aristotle says that "a discussion of friendship would naturally follow, since it is a virtue or implies virtue, and is besides most necessary with a view of living. For without friends no one would chose to live, though he had all other goods" (1155a). This statement alone moves towards a solution to the problem of alienation and moral schizophrenia. If virtuous agents can hold friendship as a central component of their lives, they can develop lasting relationships without abandoning morality. In fact, Aristotle sees friendship as an essential aspect of morality rather than a detriment to it: "the friendship of good men is good, being augmented by their companionship; and they are thought to become better too by their activities and by improving each other; for from each other they take the mould of the characteristics they approve" (1172a). From this quote, we see that virtuous agents require other virtuous agents to fully live the good life. Without friends, the virtuous agent cannot exist. This shows that friendship is an essential aspect of Aristotle's morality.

Classifying friendship as a virtue has several immediate advantages over deontological or consequentialist definitions. First, it places it among the traits that one can learn through habituation. Aristotle states: "Virtue, then, being of two kinds, intellectual and moral, intellectual virtue in the main owes both its birth and its growth from teaching...while moral virtue comes about as a result of habit" (1103a). Since friendship is a moral virtue, the virtuous person can only learn proper friendship from practicing it and observing others. This presents an agreeable model for learning friendship because it allows subjective influences to affect the

process rather than defining friendship as part of an objective deontological rule set or a consequentialist mechanism. Indeed, each virtuous agent can discover friendship through his or her own experiences. This shows friendship to be something that the virtuous agent cannot learn from a book or a defined set of objective codes. This is precisely the way that Railton views friendship when he claims that there is “something missing” in John and Anne’s relationship (136). Thus, virtue ethics immediately allows for a flexibility in the nature of friendship that the other ethical theories do not.

Additionally, virtue ethics has the advantage of describing friendly dispositions as permanent states of character without resorting to complicated philosophical disputation. Unlike consequentialism, according to which permanent states of character only inhibit possible consequences, virtue ethics encourages the virtuous person to facilitate dispositions and character traits. These character traits are closely linked with virtue, and they are permanent in nature (as long as the agent remains virtuous). Indeed, Aristotle sees the impermanent nature of utility-based friendships as a problem. He claims, “And thus these friendships are only incidental; for it is not as being the man he is that the loved person is loved, but as providing some good or pleasure. Such friendships, then, are easily dissolved” (1156a). Of true friendships, Aristotle states: “Perfect friendship is the friendship of men who are good, and alike in virtue...and they are good in themselves...And such a friendship is as, might be expected, permanent, since there meet in it all the qualities that friends should have” (1156b). Here, Aristotle identifies the same problem in consequentialist friendships as does Cocking and Oakley. By nature, friendships based on maximizing consequences are easily dissolved and impermanent. This impermanence either alienates the potential friends from their relationships or forces them to develop a schizophrenic rift between their actions and motivations.

Furthermore, Aristotle's conception of goodwill can solve the problem of differentiating between professional relationships and true friendship. This problem, for instance, is illustrated in the doctor patient example described above. Aristotle sees goodwill as the beginning of friendship, and he claims that goodwill can also count as a virtue. In his words: "Goodwill is a friendly sort of relation, but it is not identical with friendship; for one may have goodwill both towards people whom one does not know, and without their knowing it, but not friendship" (1166b). By severing goodwill from friendship and describing it as a related virtue, we see that a virtuous doctor holds goodwill towards his her patients but need not count them as friends. Since goodwill is the beginning of friendship, the doctor may very well develop friendships with some of her patients even after they have left her care. In either case, the doctor's friendly disposition is a permanent character trait that is inextricably linked to her morality. Virtue ethics allows for subjective virtues like goodwill that serve to develop a more complex account of friendship. Consequentialism and deontology, on the other hand, focus on objective action guidance, and they can only provide a description of objective, professional relationships. Additionally, since the virtuous doctor is motivated to act in a virtuous manner (guided by the virtues of goodwill and friendship), her actions are in accordance with her motivations. Depending on which virtue is relevant, she can develop both professional relationships and true friendships. Thus, she is able to both act morally and maintain friendships, avoiding the problem of moral alienation and schizophrenia.

From this analysis, we see that virtue ethics fundamentally deals with the character traits and dispositions of the virtuous person. On the other hand, deontology and consequentialism focus on what the moral agent should do rather than who the moral agent should be. Focusing on the actions themselves requires deontologists and consequentialists to adopt an objective

moral viewpoint that divorces them from their subjective feelings and either alienates them from their relationships or forces them to develop a schizophrenic rift between their actions and their values. Virtue ethics, on the other hand, allows for the development of permanent pro-friendship dispositions and gives the virtuous agent the opportunity to live both morally and well. Ultimately, focusing on the virtuous person and identifying friendship as a virtue necessary for living the good life solves the problems of moral schizophrenia and alienation. This shows not only that virtue ethics can hold its own against theories like deontology and consequentialism, but that virtue ethics can better solve some difficult meta-ethical problems. In the case of friendship, Aristotelian virtue ethics provides an account in which friendship is a moral virtue necessary for the good life. Clearly, friendship is essential to virtue ethics in a way that it can never be to consequentialism or deontology. The question then becomes: How do we live our lives, with friendship as a footnote or as inextricably linked to our morality?
