Applied Computer Vision in Robotics

Team Waitinglist:

- Ross Kidson
- Alvaro Gauterin
- Karol Hausman
Project Motion Planning

- Motion planning in static scenarios
Motion planning in dynamic scenarios
Different motion planning libraries:

- **OMPL**
  - Sampling based planning library
  - No collision detection provided
  - Difficult integration with ROS

- **SBPL**
  - Search based planning library
  - No dynamic model of a car
Static Scenario - OMPL Theory

- Probabilistic Motion Planning
  - Rapidly exploring random tree (RRT)

[Kavraki, Svetska, Latombe, Overmars, 96]
Static Scenario - OMPL Approach

- OMPL → incorporate dynamics of a car
- Implement collision detection

- Dynamics of the second order car:

\[
\begin{align*}
\dot{x} &= v \cos \theta \\
\dot{y} &= v \sin \theta \\
\dot{\theta} &= \frac{vm}{L} \tan \phi \\
\dot{v} &= u_0 \\
\dot{\phi} &= u_1
\end{align*}
\]
Static Scenario – OMPL Results

- Suboptimal
Static Scenario – OMPL Results

- Suboptimal
SBPL Planner uses ARA* (Anytime Repairing A*) algorithm that was developed by Maxim Likhachev at CMU.

A* algorithm
- Can be slow
- Always optimal
ARA* algorithm

- A* with inflated heuristics
  - Actual heuristics multiplied by an inflation factor $\epsilon > 1$
  
  $$f(s) = g(s) + \epsilon * h(s)$$

- Suboptimal but faster $\rightarrow$ suboptimality is predictable
- Many iterations $\rightarrow$ $\epsilon$ is getting smaller
- If there is time remaining $\rightarrow$ try with smaller $\epsilon$
Static Scenario - SBPL Approach

- SBPL integration with Rviz
- User Interface by clicking start and goal poses
- Integration with BMW Software
Static Scenario – SBPL Results
Static Scenario - SBPL Results
Dynamic Scenario

- Overtaking a car
- AI involved?
Dynamic Scenario - PLAN

THE PLAN:
- Accelerate on the emergency lane
- Change to the lane on the left
- Again – change to the lane on the left
- Keep driving straight ahead
Dynamic Scenario – Check list

- Check list – to be checked every second:
  - Is there a threat by the car in front of me?
  - Is there a threat by the car behind me?
  - Execute the plan
Dynamic Scenario – Check list

- Threat by a car in front
  - If distance smaller than half of my velocity → slow down
Dynamic Scenario – Check list

- Threat by a car behind
  - If distance smaller than half of his/her car → accelerate
Dynamic Scenario – Plan
Execution

- Acceleration on emergency lane
- Accelerate to the avg velocity of the cars on the left lane next to me

- v=85 km/h
- v=100 km/h
- v=90 km/h
- Accelerate to Target Speed
  v=87.5 km/h
- v=0 km/h
Dynamic Scenario – Plan
Execution

- Can I change a lane?
  - Lane change takes 3 sec.
  - Where would I be if I change the lane?
  - Where would other cars be in 3 sec.?
  - Calculate hypothetical distances to the car in front and behind me
    - If distances too big → do not change the lane
Dynamic Scenario – Plan Execution

- If a lane change is not possible
  - Is the problem a car in front of me? → slow down
  - Is the problem a car behind me?
    - is it slower than me? → accelerate in order to change the lane
    - Is it faster than me? → keep the same velocity so that other car can overtake me
Dynamic Scenario – Final Result?
Dynamic Scenario – Final Result
Thank you
