Agenda

• Who are we and how did we get here?
• Overview of key technologies
• Brief demo of tutorial application (ReSTBots)
• Tutorial exercises
• Best practices
• Conclusion

Monday, March 23, 2009
Who are we?

• Developers of spacecraft operations tools from NASA
• Long-time users of the Eclipse Rich Client Platform
• Recent users of server-side Equinox
• New fans of ReSTful web application development

Maestro, one of our operations tools
Maestro, one of our operations tools
Maestro, one of our operations tools
ReSTful space exploration

• Sequences, Plans, Mars Images, and Targets are resources

• Variety of persistence layers
  • Relational Databases
  • CDO Repositories
  • File System

• Stereoscopic range queries, spatial queries, and full text searching capabilities

• Authentication AND authorization via LDAP
Customers and Clients

- Customers
  - Scientists
  - Rover Planners
  - Sequence Engineers

- Clients
  - C/C++
  - Python, unix shell scripts
  - ActionScript
  - Java
What brought us to ReST & Equinox: Migrating capabilities to the server

What is Server-Side Equinox?

Server-Side Equinox provides the Eclipse RCP plug-in development model for server-side applications

- Allows the embedding of the Eclipse plug-in environment inside a application server (i.e., Apache Tomcat)
- Uses the same development environment as the Rich Client Platform
- Supports inspection of running programs via an interactive console
- Provides dynamic extensibility
  - Add new plug-ins without restarting server
Eclipse RCP + Server-side Equinox = “Tierless Computing”

• Develop many plugins independent of deployment environment
• Share some capabilities between server and client
• Freely migrate capabilities back and forth as needed
• Use a consistent development environment (Eclipse) and component model (OSGi) throughout
• Debug clients and servers simultaneously!
Why not SOAP?

- SOAP and ReST are both viable ways to deploy webapps.

- *In our experience*, ReST services have been easier to develop and, more importantly, easier for others to use.

- Your mileage may vary!

Our perception of the difficulty of using web services:

- ReST
- SOAP
ReST and Resource Oriented Architectures

Applications divided into resources (nouns), not services (verbs)

Relies on HTTP methods to define operations on resources

Communicate through exchanging representations of resources: Representational State Transfer

Stateless and asynchronous (just like HTTP)

Question: How would you make these servlet URLs ReSTful?

http://foobar.com/viewUserDetails?userId=123
http://foobar.com/addNewUser?userId=456&name=“Jeff”&team=“blue”
http://foobar.com/findUsers?nameContains=“Je”
ReST leverages http

• Standard, well-documented protocol for communication between a client and server

• URIs for *everything*
  
  • Universal addressability
  
  • Easy linking among resources

• Provides the essential CRUD operations on resources

  • PUT, GET, POST, DELETE

• Cacheable

• Easy to use in every programming language (even scripting languages)

• Easy to test from a web browser (esp. Firefox with Poster plugin)

**Question:** When should you use POST instead of PUT?
Reporting status from ReSTful applications

- HTTP Status Codes provide a rich, standardized language for describing the server’s response to a request. Examples:

  - **Successful Codes (2XX):**
    - 200 OK
    - 201 Created
    - 202 Accepted
    - 204 No Content

  - **Redirection Codes (3XX):**
    - 301 Moved Permanently
    - 304 Not Modified

  - **Client Error (4xx):**
    - 400 Bad Request
    - 401 Unauthorized
    - 403 Forbidden
    - 404 Not Found
    - 405 Method Not Allowed

  - **Server Errors (5xx):**
    - 500 Internal Server Error

Question: What code would you use to indicate that the client included invalid characters in the request? To report that the server ran out of memory? To reject a deletion request?
Restlet (http://www.restlet.org/)

- API developed by Noelios Consulting
- Streamlines the development of ReSTful webapps
- Addresses some limitations of traditional servlets
  - Provides powerful URI mapping and parsing capabilities
  - Decouples IO from web applications

http request -> Restlet Router -> Restlet Restlet Restlet

Monday, March 23, 2009
Ensemble ReST Framework

• Simply an integration of the Restlet API with Equinox, developed by NASA

• Allows easy definition of new Restlet Resources via extension points

• Provides some convenience utilities for handling requests

• Open source! All code provided in this tutorial is available online via the Open Channel Foundation
Tutorial
Our Toy Example: ReSTBots

• ReSTBots are simple robot simulations with the following attributes:
  • Name
  • Position (x,y) - the current location of the ReSTBot
  • Goal (x,y) - where the ReSTBot has been commanded to move to
  • Direction (x,y) - current drive direction (velocity vector)
• ReSTBots repel each other like identically charged particles
• ReSTBots can be represented in XML

```xml
<Restbot name="Foo"
x="1" y="2"
gx="3" gy="4"
dx=".1" dy=".1"/>
```
ReSTBot Server

- ReSTful server containing the following resources:
    - All ReSTBots on the server
  - http://localhost:8180/restbots/{name} → RestbotResource
    - A single named ReSTBot
  - http://localhost:8180/restbots/{name}/pic → RestbotPictureResource
    - The picture for a named ReSTBot

Question: What would you expect to happen if you performed a PUT on the second resource URL? How would you interpret a return code of 409 (CONFLICT)?
ReSTBot execution loops

- ReSTBots execute this loop:
  - GET current position and goal
  - Compute a new direction and POST it

- The ReSTBot server executes this loop:
  - For each ReSTBot:
    - Access its current position and direction
    - Compute a new position based on the direction

- Other clients can inject new goals for ReSTBots

Yes, there is a synchronization problem here. Correcting it would have made this tutorial a lot more complicated.
Overview of tutorial application

- Restbot
  - POST direction to server
  - GET position, goal from server

- Restbot Server
  - GET robot states from server
  - PUT restbot to server
  - GET robot positions from server
  - POST goal to server

- Restbot Installer
  - DELETE restbot from server

- Web Browser
  - GET robot states from server

- Restbot Client
Tutorial Plugins

- `gov.nasa.ensemble.core.restlet` → Ensemble Equinox/ReSTlet System

- `gov.nasa.ensemble.restbots.client`  
  `gov.nasa.ensemble.restbots.common`  
  `gov.nasa.ensemble.restbots.server` → Example plugins developed specifically for this tutorial

- `org.apache.commons.codec`  
  `org.apache.commons.httpclient`  
  `org.apache.log4j`  
  `org.apache.xalan-j` → Third-party utilities for http, logging, and XML translation

- `org.restlet` → Noelios ReSTlet API

Monday, March 23, 2009
Exercise 0: Launch the ReSTBot System

- Switch to “workspace_0”

- Goals:
  - Create and start a runtime config for the ReSTBot Server
  - Start RestbotClient to visualize the arena
  - Start RestbotInstaller to add robots to the arena

- You’ll need this command-line argument:
  - -Dorg.eclipse.equinox.http.jetty.http.port=8180
1. Navigate to the `type filter text` section.
2. Select the `New_configuration` item.
3. Type the name "ReSTBot Server" into the `Name` field.
5. Ensure the desired bundles are selected in the `Start Level` column.
6. Scroll down and add `org.eclipse...jetty`.
7. Click the `Add Required Bundles` button.
8. Validate the bundles and apply the changes.
VM arguments:

-Dosgi.ignoreApp=true -Dosgi.noShutdown=true
Startup Procedure

First, stop all running applications!

1. Start First
2. Start Second
3. Start Third

Normal Startup Output

Monday, March 23, 2009
The OSGi Console

• Great tool for managing your OSGi environment
• Allows you to diagnose, install, uninstall, start, stop, update bundles
• Similar functionality available through a web interface:
  • Knopflerfish http_console
Firefox Poster Plugin (Testing)
CRUD with Restlet 1.1

- storeRepresentation(Representation entity)
  - Called by handlePut()
- represent(Variant variant)
  - Called by handleGet()
- acceptRepresentation(Representation entity)
  - Called by handlePost()
- removeRepresentations()
  - Called by handleDelete()
Exercise 1

- Switch to “workspace_1”

- Goals:
  - Learn how to accept updates to a resource
  - Write a client that updates a resource

- Classes to modify:
  - `gov.nasa.ensemble.restbots.server.RestbotResource`
    - `acceptRepresentation()` - accept updates to ReSTBot direction and goal
  - `gov.nasa.ensemble.restbots.common.Restbot`
    - `updateGoal()` - POST updated goal based on mouse click in RestbotClient view
@Override
public void acceptRepresentation(Representation entity) throws ResourceException {
    String name = getRequestParameter("name");
    Restbot restbot = Restbot.getRestbot(name);

    try {
        if (restbot == null) {
            // TODO send proper response if restbot is not found
            getList().setStatus(Status.CLIENT_ERROR_NOT_FOUND, "No restbot with this name exists");
            return;
        }

        InputStream inputStream = getRequest().getEntity().getStream();
        if (restbot.updateFromXML(inputStream)) {
            getList().setStatus(Status.SUCCESS_OK, "Restbot updated");
        } else {
            getList().setStatus(Status.CLIENT_ERROR_BAD_REQUEST, "Check the XML in the body");
        }
    }
    catch (ParserConfigurationException e) {
        trace.error(e);
        getList().setStatus(Status.CLIENT_ERROR_BAD_REQUEST, e.getMessage());
    }
    catch (NumberFormatException nfe) {
        trace.error(nfe);
        getList().setStatus(Status.CLIENT_ERROR_BAD_REQUEST, nfe.getMessage());
    }
    catch (IllegalStateException ise) {
        trace.info(ise);
        getList().setStatus(Status.CLIENT_ERROR_BAD_REQUEST, "The restbot name does in the body does not match the URI");
    }
    catch (IOException e) {
        trace.error(e);
        getList().setStatus(Status.SERVER_ERROR_INTERNAL, "IOException while reading from input stream");
    }
}
/**
 * This method is used to update the server about the direction of the
 * rover. The server may give consideration to the direction of the rover
 * when calculating the new position of the rover. Before updating the
 * server, the restbot will calculate its direction based on its current
 * position and the goal position.
 */

public void updateGoal() {
    Document doc;
    HttpClient client = HttpClientUtils.getClient();
    PostMethod post = new PostMethod(resbotURI);
    try {
        doc = DocumentBuilderFactory.newInstance().newDocumentBuilder().newDocument();
        Element restbotElement = doc.createElement("restbot");
        doc.appendChild(restbotElement);
        restbotElement.setAttribute(Restbot.NAME_ATTR, getName());
        restbotElement.setAttribute(Restbot.GOAL_X_ATTR, String.valueOf(getGoalX()));
        restbotElement.setAttribute(Restbot.GOAL_Y_ATTR, String.valueOf(getGoalY()));
        String docAsStr = Restbot.serializeDocument(doc);
        StringRequestEntity requestEntity = new StringRequestEntity(docAsStr, "text/xml", "UTF-8");
        post.setRequestEntity(requestEntity);
        int resp = client.executeMethod(post);
        trace.info("Updated the server with my goal and received response:" + resp);
    } catch (ParserConfigurationException e) {
        trace.error(e);
    } catch (IOException e) {
        trace.error(e);
    } finally {
        post.releaseConnection();
    }
}
Exercise 2 : Your own resource

• Switch to “workspace_2”

• Goals:
  • Create, register, and develop a new resource
  • Leverage the ReSTIlet API for operating on the resource
  • Use HTTP status codes

• Tasks:
  • Create a new resource
  • Register the resource through extension point
  • Implement required methods
  • Modify client to access the resource
  • Add status codes to your resource
  • Modify client to interpret and handle status codes
Adding a new Resource

- Open plugin.xml from gov.nasa.ensemble.restbots.server
- Switch to the Extensions tab
- Right-click on Extension point and add new Resource

- Fill out details
- Recommended class name: gov.nasa.jpl.maestro.restbots.server.RestbotPictureResource
- Move new extension point to top
@Override
public void represent(Variant variant) {
    String restbotName = getRequestParameter("name");
    Restbot restbot = Restbot.getRestbot(restbotName);
    if (restbot == null) {
        getResponse().setStatus(Status.CLIENT_ERROR_NOT_FOUND, "No restbot with this name exists");
        return null;
    }

    byte[] image = restbot.getImageData(false);
    if (image == null) {
        getResponse().setStatus(Status.CLIENT_ERROR_NOT_FOUND, "This restbot does not have a picture");
        return null;
    }

    return new ByteArrayRepresentation(image);
}
@Override
public void storeRepresentation(Representation entity) throws ResourceException {
    String restbotName = getRequestParameter("name");
    Restbot restbot = Restbot.getRestbot(restbotName);
    if (restbot == null) {
        getResponse().setStatus(Status.CLIENT_ERROR_NOT_FOUND, "No restbot with this name exists");
        return;
    }
    try {
        InputStream stream = getRequest().getEntity().getStream();
        ByteArrayOutputStream bout = new ByteArrayOutputStream(stream.available());
        byte[] buf = new byte[stream.available()];
        int len = 0;
        while ((len = stream.read(buf)) >= 0) {
            bout.write(buf, 0, len);
        }
        restbot.setImageData(bout.toByteArray());
    } catch (IOException e) {
        trace.error(e);
        getResponse().setStatus(Status.SERVER_ERROR_INTERNAL, e.getMessage());
    }
}
@Override
public void removeRepresentations() {
    String restbotName = getRequestParameter("name");
    Restbot restbot = Restbot.getRestbot(restbotName);
    if (restbot == null) {
        getResponse().setStatus(Status.CLIENT_ERROR_NOT_FOUND, "No restbot with this name exists");
        return;
    }
    restbot.setImageData(null);
}"
Tips, Tricks, and Best Practices
HTTP Methods

- Safe Methods
  - GET
  - HEAD

- Idempotent methods
  - GET
  - HEAD
  - PUT
  - DELETE

- Unsafe and non-idempotent method:
  - POST

Question: Why is this important?
JSR-311

- POJO based and HTTP-Centric
- Included in Java EE 6
- Discovery and description NOT a goal, but ...
- Matured into JAX-RS as of October, 2008
- Annotation based Restful programming

```java
package com.sun.jersey.samples.helloworld.resources;
import javax.ws.rs.GET;
import javax.ws.rs.Produces;
import javax.ws.rs.Path;

// The Java class will be hosted at the URI path "/helloworld"
@Path("/helloworld")
public class HelloWorldResource {

    // The Java method will process HTTP GET requests
    @GET
    // The Java method will produce content identified by the MIME Media
    // type "text/plain"
    @Produces("text/plain")
    public String getClichedMessage() {
        // Return some cliched textual content
        return "Hello World";
    }

```
More on Restlets

- Representations
- Security
  - Guards
  - Built in authentication schemes: HTTP BASIC, AWS Authentication, HTTP DIGEST support coming in Restlet 1.1
- Extensibility
Securing Your Restlets

- Container managed security vs. Restlet Security
- Guards
  - Available authentication schemes
  - Extending for custom authentication/authorization schemes
- Adding security to Ensemble ReST
- SSL
/* How to add security: */

Guard guard = new Guard (getContext(), ChallengeScheme.HTTP_BASIC, "EnsembleRealm"){
    @Override
    public int authenticate(Request request) {
        // TODO add your own authenticate method
        return super.authenticate(request);
    }

    @Override
    public boolean authorize(Request request) {
        // TODO add your own authorization method
        return super.authorize(request);
    }
};
guard.setNext(router);
return guard;
Accessing a secured Restlet with HttpClient

- Authentications scheme supported:
  - HTTP BASIC
  - HTTP DIGEST
  - NTLM

- Extensibility
  - Custom authentication schemes allowed
  - Implement the AuthScheme interface
  - Register by invoking AuthPolicy.registerScheme()

- For more information:

Alert: Take precautions with custom authentication schemes!!!
Authentication with HttpClient

- Create an AuthScope
- Create and set credentials

Question: Why is the AuthScope Important?
Apache HttpClient Performance

- Use only one client for your entire application
- Application multithreaded?
  - Use MultiThreadedHttpConnectionManager
- Release a connection after you are done with EACH request; eg: get.releaseConnection()
- Request and Response Streaming
  - InputStreamRequestEntity
  - getResponseBodyAsStream

Question: What if you need numerous simultaneous connections?
Recipe for ReSTful Web Applications

• Identify Resources that you would like to expose
• Address addressability
• Decide which operations should be allowed
• Develop the resources (make extensive use of the status codes)
• Test and Deploy
Conclusion
Ensemble ReST leverages... Eclipse and OSGi

- **Eclipse**
  - Rapid development with Eclipse (Launch Vehicle)
    - Eclipse Debugger
    - Test application from within IDE
  - Easy export process to production servers

- **OSGi**
  - Modularity in code
  - Runtime extensibility
  - Changes can be limited to specific modules
    - Rapid deployment of modifications
    - Minimizes risks when redeploying
Ensemble ReST leverages…

HTTP and ReST

- HTTP Protocol
  - Widely supported
    - Programming Languages
    - Web Browsers
  - Resources are completely decoupled
  - Fast performance, especially for binary transfers
  - Standardized authentication and encryption schemes
- ReST
Key Development Considerations

- How modular is your code base? (OSGi)
- How easy is it to access your application? (ReST)
- How hard is it to debug the application (Eclipse)
- What impact does adding a resource have on:
  - Existing clients
  - Existing applications
- How can you test your application?
  - JUnit
  - Firefox Poster Plugin
- How to secure the application and still make it accessible? (HTTP, SSL)
